Project: Import Data using Transform Maps (Spreadsheet)

ServiceNow Employee Data Flow

Coalesce on Employee ID supports matching existing records during repeat imports

Data flow description

Flow	Description
Source → staging	Employee spreadsheet is uploaded through Load Data into Employee Import (Import Set table).
Staging → transform	Sample Spreadsheet Import maps source fields to Employee Test target fields.
Transform → target	Transform execution creates target records; Coalesce on Employee ID matches existing records for updates.
Target → reporting	Employee Test supplies Employees by Department, Employees by Location and Employee List Report; these are added to Employee Analytics Dashboards.

User stories

As a...	I want to...	So that...	Acceptance criteria
ServiceNow beginner	load an employee spreadsheet into an Import Set	I can stage bulk records	Employee Import table is created and uploaded rows show completed/success state.
Administrator	map source fields to Employee Test	the data lands in the intended fields	Employee ID, Employee Name, Email, Department and Location are mapped and transform completes.
Data steward	use Employee ID as Coalesce	repeat imports update existing employees instead of duplicating them	Existing IDs update; new IDs insert; identical repeat file can be reviewed in transform history.
Reviewer	create reports and a dashboard	I can inspect employee data by department, location and list	Three reports are saved and added to Employee Analytics Dashboards.
