Project: Import Data using Transform Maps (Spreadsheet)

Requirements at a glance

Functional workflow based on the supplied project instructions

Functional requirements

ID	Requirement	Verification
FR-01	Accept employee data from an Excel spreadsheet using Load Data.	Rows appear in Employee Import staging table.
FR-02	Create Employee Test (u_employee_test) with Employee ID, Employee Name, Email, Department and Location string fields.	Fields are visible on the target form/list.
FR-03	Create Sample Spreadsheet Import Transform Map from Employee Import to Employee Test.	Source and target tables are correct; fields are mapped.
FR-04	Execute transformation and validate imported records.	Success state and records are visible in Employee Test.
FR-05	Enable Coalesce on Employee ID to handle repeat imports.	Matching IDs update; new IDs insert; repeated unchanged rows are reported as ignored.
FR-06	Create Employees by Department (pie/count), Employees by Location (bar/count), and Employee List Report.	Each report runs and saves with specified grouping/columns.
FR-07	Create Employee Analytics Dashboards and add all three reports.	Dashboard displays the three reports.

Quality and operational considerations

Area	Requirement / source-supported check
Data integrity	Validate field mapping and compare transform history with Employee Test rows.
Repeatability	Re-run the same spreadsheet and inspect inserted, updated and ignored outcomes.
Usability	Arrange target list columns using Personalised List Columns.
Access	Dashboard creation via backend form depends on the documented ACL/Admin Overrides access; use permitted access.

Out of scope / unspecified

The source does not specify performance thresholds, external APIs, hosting, or security-role design beyond the dashboard ACL note.
