

PROJECT REPORT

Import Data using Transform Maps (Spreadsheet)

[illegible]

1. INTRODUCTION

1.1 Project Overview

The project demonstrates importing employee data from a spreadsheet into ServiceNow using Import Sets and Transform Maps. The process stages source rows, maps fields to a target employee table, checks repeat-import behavior, and presents records through reports.

1.2 Purpose

To reduce manual entry, provide a repeatable spreadsheet import process, avoid duplicate employee IDs during subsequent imports, and make employee information easier to review.

2. IDEATION PHASE

2.1 Problem Statement

Employee details maintained in spreadsheets must be transferred accurately into ServiceNow. Manual entry and repeat uploads may lead to mapping mistakes, repeated records and difficult verification.

2.2 Empathy Map Canvas

Persona: HR administrator or ServiceNow administrator. Thinks/feels: wants reliable records and confidence after import. Sees: spreadsheets, import status and employee lists. Says/does: prepares files, uploads, maps fields and checks results. Pains: field mismatches, duplicate IDs and unclear outcomes. Gains: consistent records and clear reports.

2.3 Brainstorming

Use Load Data for bulk ingestion; stage rows in Employee Import; map the five employee fields; use Employee ID as Coalesce; review transform history; create department, location and list reports on a dashboard.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey map

Prepare XLSX → Load Data → create/select Employee Import → configure Employee Test and Transform Map → run transform → validate target/history → review reports/dashboard.

3.2 Solution Requirement

Required fields: Employee ID, Employee Name, Email, Department, Location. Functional needs: spreadsheet upload, staging, mapping, transform, coalesce, verification and three reports.

3.3 Data Flow Diagram

Employee spreadsheet → Employee Import staging table → Sample Spreadsheet Import Transform Map → Employee Test target table → saved reports → Employee Analytics Dashboards.

3.4 Technology Stack

ServiceNow platform, Load Data/Import Sets, Transform Map, Employee Import and Employee Test tables, Coalesce on Employee ID, ServiceNow Reports and Dashboards. No separate external stack is specified.

4. PROJECT DESIGN

4.1 Problem Solution Fit

A ServiceNow-native import workflow addresses bulk ingestion, field alignment, repeat-import matching and post-import verification without requiring manual entry of each employee.

4.2 Proposed Solution

Upload the employee XLSX, stage records, map the five fields, enable Coalesce on Employee ID, execute the transform, inspect history and publish the three reports to the dashboard.

4.3 Solution Architecture

Source spreadsheet → staging/import set → transform map → target employee table → reports/dashboard. Validate field mappings and inserted/updated/ignored outcomes after each run.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Sprint 1: prepare spreadsheet, create Employee Test, load Employee Import, configure Transform Map and verify field mappings. Sprint 2: run and validate transform, configure Coalesce, test repeat import, create reports and assemble dashboard. Actual dates and completion points should be updated by the team.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Functional checks: valid XLSX upload, target fields, field mapping, new ID insert, existing ID update, repeat-file behavior, transform history and report/dashboard access. Performance observation: record source row count and elapsed import time during execution; no fixed threshold is specified.

7. RESULTS

7.1 Output Screenshots

Insert actual screenshots of Load Data completion, Transform Map mappings, Employee Test records, transform history, three reports and Employee Analytics Dashboards. Results are pending execution evidence.

8. ADVANTAGES & DISADVANTAGES

Advantages

Bulk spreadsheet ingestion; repeatable field mapping; Employee ID coalescing; transform-history visibility; report-based review.

Disadvantages

Depends on consistent source headers and correct mapping; requires appropriate ServiceNow permissions; actual throughput and error rates must be measured.

9. CONCLUSION

Conclusion

The proposed workflow provides a structured method to import employee spreadsheet data into ServiceNow, handle matching Employee IDs and review the resulting information through reports. Completion should be confirmed with actual test evidence.

10. FUTURE SCOPE

Future Scope

Add pre-import data-quality checks, approved scheduling for recurring imports, documented role/access requirements, and additional employee analytics if requested.

11. APPENDIX

Source Code (if any)

No custom source code is specified; ServiceNow configuration artifacts form the implementation.

Dataset Link

Sample employee spreadsheet used by the project team; add its approved shared link here.

GitHub & Project Demo Link

Not specified; add repository/demo URL if the team publishes one.
